

ABSTRACT

An intermediate product carrying apparatus is provided for loading a carrier, which is carried between a plurality of process systems and stores a plurality of intermediate products, into the corresponding process system, and then transferring the plurality of intermediate products of the carrier to a single wafer carrying conveyer, which carries the intermediate products in a single wafer state to an intermediate product manufacturing apparatus provided in the process system. The intermediate product carrying apparatus comprising: an intermediate product transfer means provided in the process system, for loading the carrier, which is carried between process systems and which stores the plurality of intermediate products, into the corresponding process system, and transferring the intermediate products.
